Belgian HOWTO

by Dag Wieërs, dag@mind.be

v1.0.29, 15 October 2000

This document describes how to tweak Linux for Belgian users and lists Linux user groups, businesses and other resources in Belgium.

1. Introduction

1. Introduction

1.1 Why this document?

Since there was no information anywhere on the net for Belgian Linux users, we started to collect stuff that we thought could be important. This HOWTO aims to be the definitive list of all Belgian–related Linux

information. If you think not, you have no excuse to complain and certainly not to not contribute. ;)

1.2 New versions of this document

If you need to know more about the Linux Documentation Project or about Linux HOWTO's, feel free to contact the supervisor Tim Bynum linux-howto@sunsite.unc.edu.

Tim Bynum will post the listing to several national and international newsgroups on a monthly basis. In addition, the Belgian HOWTO can be found on the World Wide Web at <http://dag.mind.be/howto/>. New versions of the Belgian HOWTO are always placed at this site first, so please be sure to check if the copy you are reading is still up to date!

1.3 Translated versions

This document is currently translated in 3 languages (English, Dutch and French), we're trying to keep all three of them in sync, but the English version is the source-document!

The English and Dutch version are maintained by Dag Wieërs dag@mind.be and is found at: <http://dag.mind.be/howto/>.

The French version is maintained by Dany Vanderroost danyv@euronet.be and is found at: <http://club.euronet.be/dany.vanderroost/howto.html>.

1.4 Contributions

A few people mailed us their suggestions and improvements, thanks go to:

- Wim Vandepitte wvdeputte@reptile.rug.ac.be
- Pablo Saratxaga srtxg@ping.be
- Christophe Lambin clambin@skynet.be
- Geert Uytterhoeven geert@linux-m68k.org

Many thanks go to Ivo Clarysse soggie@iguana.be who started something similar earlier (<http://linbel.iguana.be/>) and his project helped us a lot to get this document online.

1.5 Feedback

If some information seems to be wrong, deceptive or missing, we'd appreciate if you mailed us the improvements. Since we're just human this document isn't bug-free, but your contribution can and will make a difference.

To add yourself to the Linux user groups or businesses, collect all necessary information and mail it to us.

1.6 Legal stuff

Trademarks are owned by their owners.

Although the information given in this document is believed to be correct, the author will accept no liability

for the content of this document. Use the tips and examples given herein at your own risk.

Copyright © 1998, 1999, 2000 by Dag Wieers. This document may be distributed only subject to the terms and conditions set forth in [the LDP license](#).

1.7 Todo

There are some things I'm planning to add to this document, if you're interested be sure you're reading the most current version of this document. (This todo-list is only a reminder to myself, it is not in the translated documents!)

- Make a distinction between Linux-distributors, Linux-training and Linux-companies
 - ◆ <http://www.kangaroot.net/>
 - ◆ <http://www.businesstraining.be>, <http://www.aragne.com>, <http://mind.be>, <http://life.be>, IBM, SGI
 - Integrate [LinBel](#) some more (should have done this a long time ago)
 - Describe possible ways to get a cheap recent Linux-distribution in your neighbourhood
 - Add details about how to get Ispell-software for your own language
 - Add information about translating programs
 - Add more information about ADSL/DANA
 - Translate it to [DocBook DTD](#)
 - Link it from inside the Linux.be website at <http://linux.iguana.be/> (database-driven)
-

2. [Configuration](#)

2.1 Keyboard setup

Linux provides 2 ways to set up your keyboard. At the console you can use `loadkeys` and under XFree86 you can use `xmodmap`.

Console

To use the keytable for a Belgian keyboard you can use

```
loadkeys be2-latin1
```

or

```
loadkeys be-latin1
```

The only difference between the two is that `be2-latin1` add support for twosuperior and threesuperior (keycode 41) and grave (keycode 43).

Usually `loadkeys` is started at boottime from the scripts located somewhere in `/etc/rc.d`. Different distributions handle it differently. But most distributions have a simple program (like `kbdconfig` in RedHat or `yast` in SuSE) to change the scripts.

XFree86

To set your keyboard properly under XFree86 you've got more choices. By running `Xconfigurator` (or a similar program) a config-file for XFree86 is created (with some standard content). This file is called `XF86Config` and is usually located in `/etc` or `/etc/X11`

Make sure (and change otherwise) that something similar to this is given under the `Keyboard Section`.

```
Section "Keyboard"
    Protocol      "Standard"
    XkbRules     "xfree86"
    XkbModel     "pc101"
    XkbLayout    "be"
EndSection
```

If you own a 'microsoft' keyboard (or the less-known penguin keyboards ;p) you can enable those extra 3 keys by changing the "pc101" into "pc104". (I use the extra keys as meta-keys in my windowmanager so some shortcuts doesn't conflict with the internal ones of my wm).

To get the AltGr key to work under XFree86 simply add in the `Keyboard Section`:

```
RightAlt      ModeShift
```

To get some key-combinations working under X11, you might want to change in file `/usr/X11R6/lib/X11/xkb/symbols/be`:

```
key <AD11> { [ dead_circumflex,          diaeresis      ],      }
              [ bracketleft           ]      } ;
key <AC11> { [ ugrave,                  percent       ],      }
              [ quoteright             ]      } ;
key <BKSL> { [ mu,                     sterling     ],      }
              [ quotelleft            ]      } ;
key <AB10> { [ equal,                  plus        ],      }
              [ asciitilde             ]      } ;
```

by

```
key <AD11> { [ dead_circumflex,  dead_diaeresis   ],      }
              [ bracketleft       ]      } ;
key <AC11> { [ ugrave,                 percent       ],      }
              [ dead_acute         ]      } ;
key <BKSL> { [ mu,                   sterling     ],      }
              [ dead_grave        ]      } ;
key <AB10> { [ equal,                 plus        ],      }
              [ dead_tilde         ]      } ;
```

Some people prefer to use a 'compose'-key to enter their special characters, like:

```
<compose>'e => é
<compose>/o => ø
<compose>c, => ç
<compose>co => ©
```

```
<compose>ss => ß
```

Solution:

```
xmodmap -e "keycode xx = Multi_key"
```

or

```
xmodmap -e "keysym yy = Multi_key"
```

and 'xx' is the keycode and 'yy' the keysym of the key you choose to be the 'compose'-key. (use xev to get these values)

Alternatively you can add

```
keycode xx = Multi_key
```

to your *.xmodmaprc*. This way it happens automagically.

2.2 Display and applications

Some applications have to be compiled as 8-bit clean to work well with the European character set. Others like to be told in advance.

Using the ISO-8859-1 font in console

You can load the ISO-8859-1 font by typing the following in console:

```
setfont latlu-16.psf
mapscren trivial
echo -ne '\033(K'
```

To be able to use è, è, é or ç in console, you might want to add these to your *.inputrc*:

```
set meta-flag on
set convert-meta off
set output-meta on
```

(this must be done for every user, if you want this to be default for all users you can either add this file to */etc/skel/* or you could add these lines to */etc/inputrc* and add the following line to */etc/bashrc*,

```
export INPUTRC=/etc/inputrc
```

)

Note: this is only useful to programs that use readline (like bash) Also set the following environment

variables:

```
LC_CTYPE=iso-8859-1
SYSFONT=latlu-16.psf
SYSTERM=linux
```

Support for the Euro symbol

Since Europe had to invent a new character, the Euro, there's a new standard. It's called ISO-8859-15 (aka Latin-9 or Latin-0). To add support you need both a new font and new keymaps. This is part of every major distribution nowadays, if you have an older distributions you probably need a newer `console-tools` package.

The changes in the keymap-file consist of the following lines:

```
keycode 18 = +e          +E      currency
keycode 46 = +c          +C      cent
```

And the following environment-variable should be set:

```
SYSFONT=lat0-16.psf
```

to make sure you're using the right font.

2.3 Time zone

Since Belgium is located in the Central European Time zone (aka MET) which (in the winter) is equivalent to the Greenwich Mean Time plus 1 (GMT+1), you can simply link `/usr/lib/zoneinfo/localtime/MET` to `/etc/localtime` symbolically like:

```
ln -sf /usr/lib/zoneinfo/MET /etc/localtime
```

or

```
ln -sf /usr/lib/zoneinfo/Europe/Brussels /etc/localtime
```

This automagically sets Daylight Savings (which is GMT+2 in the summer).

Note: that different distributions have different paths, zoneinfo can be located in `/usr/share` or such...

Note2: RedHat uses a tool called `timeconfig`, SuSE uses `yast`

To change the CMOS clock and then synchronize the system time with the CMOS clock, do something like this:

```
hwclock --set --date="Feb 25 03:38"
clock -u -s
```

If your clock is set to local time (which is discouraged but if you have other OS's installed a must), you can do:

```
hwclock --set --date="Feb 25 04:38"  
clock -s
```

[Noticed the 1 hour difference ? ;p]

2.4 Locale support

Not much programs support locale yet, if you want to know more about locale or how to write your own programs to support it, check: [put the damn url here ;p]

Be aware that locale makes it harder to resolve problems as less people can help you !! You might understand a problem when it's in technical English, but what if it's translated in some obscure French ?!? Some obviously won't understand both. ;p

Dutch

To enable support for the Dutch locale in Belgium on a system with locale support you just have to set the following environment variables:

```
LANG=nl  
LANGUAGE=nl_BE
```

Try nl_BE.ISO_8859-1 if nl_BE does not work.

French

If you want French locale support in Belgium, set the following environment variabels:

```
LANG=fr  
LANGUAGE=fr_BE
```

Try fr_BE.ISO_8859-1 if fr_BE does not work.

German

If you want instead German locale support in Belgium, set the following environment variabels:

```
LANG=de  
LANGUAGE=de_BE
```

Try de_BE.ISO_8859-1 if de_BE does not work.

Walloon

For Walloon locale support you can find files and information at: <http://www.linux18n.org/locales/walon/>. To use it set:

```
LANG=wa
LANGUAGE=wa_BE:fr_BE
```

Try wa_BE.ISO_8859-1 if wa_BE does not work.

2.5 Native language support and codepages

These options add support for the Belgian characterset and codepages. If you'd like to have these, compile a kernel with these options put on. They only apply to some filesystems (FAT-based, ISO9660, ...).

```
< > Codepage 850 (Europe)
< > NLS ISO 8859-1 (Latin 1; Western European Languages)
< > NLS ISO 8859-15 (Latin 9; Western European Languages with Euro)
```

Located in Filesystems > Native Language Support

If your kernel is a modular kernel that came with your distribution (=you never compiled a kernel before), then you might want to type:

```
insmod nls_cp850
insmod nls_iso8859_1
insmod nls_iso8859_15
```

3. Setting up Internet (Belgian ISP information)

3.1 Dialing in with your modem (PPP)

To configure PPP correctly, you should check the [PPP-HOWTO](#). I try to explain it briefly, but if you have any questions or problems, read the HOWTO very carefully.

Configuring the modem

To configure your modem, you can alter the initstring of your modem. To learn more about your modem, check [Ask Mr. Modem](#).

Beware: if you have a winmodem you will probably not get it to work. More information about winmodems is at: <http://linmodems.org/>. Work is underway, but winmodems are not as good as *real* modems.

Installing pppd

Now, you need to have the ppp–package installed (check this by typing `pppd --version`), make sure you have a recent one. Then you have to make sure you've got these files:

/usr/local/bin/ppp

```
#!/bin/sh
case $1 in
    on|start)
        TELEPHONE='555-1212'      # The telephone number for the connection
        ACCOUNT='your_login'       # The account name for logon (as in 'George Burns')
        PASSWORD='your_pass'       # The password for this account (and 'Gracie Allen')
        INITSTRING='AT&F&C1&D2Z'# Modem initstring
        IPLOCAL=0.0.0.0            # Local IP address if known. Dynamic = 0.0.0.0
        IPREMOTE=0.0.0.0           # Remote IP address if desired. Normally 0.0.0.0
        DEVICE=/dev/ttyS1          # Serial Device com1=ttyS0, com2=ttyS1, ...
        SPEED=57600                # 19200, 38400 or 57600 (don't try something different)
        export TELEPHONE ACCOUNT PASSWORD INITSTRING
        exec /usr/sbin/pppd $DEVICE $SPEED $IPLOCAL:$IPREMOTE \
              user $ACCOUNT connect /etc/ppp/ppp-on-dialer
    ;;
    off|stop)
        if [ -r /var/run/ppp0.pid ]; then
            kill -INT `cat /var/run/ppp0.pid`
            if [ ! "$?" = "0" ]; then
                rm -f /var/run/ppp0.pid
                echo "ERROR: Removed stale pid file"
                exit 1
            fi
        exit 0
    fi
    echo "ERROR: PPP link is not active on ppp0"
    exit 1
    ;;
    info|status)
        /usr/sbin/pppstats
    ;;
    *)
        echo "Usage: ppp on|off|info|start|stop|status";
    ;;
esac
```

/etc/ppp/ppp-on-dialer

```
#!/bin/sh
exec /usr/sbin/chat -v
REPORT CONNECTION \
REPORT CARRIER \
TIMEOUT      10 \
ABORT        '\nBUSY\r' \
ABORT        '\nNO ANSWER\r' \
ABORT        '\nNO CARRIER\r' \
ABORT        '\nNO DIALTONE\r' \
ABORT        '\nRINGING\r\n\r\nRINGING\r' \
ABORT        ' Invalid Login' \
ABORT        ' Login incorrect' \
''           "\r$INITSTRING\r" \
'OK-+++\c-OK' 'ATH0' \
```

```
TIMEOUT      45
OK          "ATDT$TELEPHONE"
CONNECT     '\d\c'
login:--login: "$ACCOUNT"
ord:        "$PASSWORD"
```

You can remove the `-v` once everything looks normal.

The pppd command uses `/etc/ppp/options` to list its options, change these options to whatever fits. These defaults normally work in most cases.

```
asyncmap 20a0000
crtscts
debug
default-mru
defaultroute
detach
escape 11,13,ff
hide-password
ipcp-accept-local
ipcp-accept-remote
lcp-echo-failure 4
lcp-echo-interval 400
lock
modem
mtu 1500
netmask 255.255.255.0
noipdefault
passive

#idle 300
#kdebug 0
#-vj
```

Once dialing in works like a charm, you can leave debug out.

Beware: it is important to emphasize that every special character, thus every character that is not [a-ZA-Z0-9] and '_', should be escaped by preceding it with a '\' -character. Thus "e!b\$l+" would become "e\\!b\\\$l\\+". Try it if you are having troubles !

pap-secrets / chap-secrets

If your ISP requires CHAP or PAP, you need one of these files with their proper username and password:

`/etc/ppp/pap-secrets` or `/etc/ppp/chap-secrets`

#client	server	secret	IP
your_login	*	your_pass	*

Network

To configure your nameservers, change `/etc/resolv.conf`. If dialing in is succesfull, but you can't get it to connect to URL's: this is probably the cause.

```
domain domain_of_your_isp
nameserver your_primary_nameserver
nameserver your_secondary_nameserver
```

File permissions

Before you can run a (shell)script, it must be set executable. Be sure that you set the permissions so that other users cannot see the passwords stored in the files. If you want other users to be able to dial in, you might want to consider using `sudo`. You might want to do the following:

```
chmod u+rwx og-rwx -R /etc/ppp
chmod u+x /etc/ppp/ppp-on-dialer /usr/local/bin/ppp
```

Dial + Hangup

Then if `/usr/local/bin` is in your PATH, you can easily dial in with:

```
ppp on
```

and hangup with:

```
ppp off
```

and to get some statistics, you do:

```
ppp status
```

ISP-dependant information

3.2 Dialing in with your ISDN–modem

Contributed by Christophe Lambin clambin@skynet.be

This section does not aim to be a definitive guide on ISDN for Linux. For a more detailed discussion on the topic, see [Paul Slootman's ISDN4Linux HOWTO](#) and [ISDN4Linux–FAQ](#).

Updating the kernel

If you're using a 2.2 kernel, it's recommended to get an updated version of the ISDN code. You can retrieve the CVS at <ftp://ftp.suse.com/pub/isdn4linux/>. For more information, check: <http://www.brisse.dk/site/linux/docs/isdn.htm>

Warning: if you've recently purchased an Eicon Diva 2.0 PCI (eg, via Belgacom), there's a good chance you've actually got a Diva 2.01. In this case, you must get a version dated 1 July 1999 or later !

Once the ISDN is in place, you can start up the driver. Eg:

```
modprobe hisax type=11 protocol=2
```

Refer to the Readme's for the right parameters and values for your card.

ISDN4Linux toolkit

Next, you'll need the ISDN4Linux toolkit. You can retrieve the latest version of the toolkit at: <ftp://ftp.suse.com/pub/isdn4linux/>

Configuring the interface

With the tools installed and configured, write a script to configure the interface, to be used for the ISDN connection. As always in Linux, there's no one correct way of doing this. I've put these in a script

/etc/rc.d/rc.isdn:

```
#!/bin/sh
MSNREMOTE='555-1212'      # Phone number of ISP
MSNLOCAL='555-1313'        # my number, without 0, with areacode
ACCOUNT='george'           # The account for logon (as 'George Burns')
IPLOCAL=10.0.0.2            # my fixed IP (use 10.0.0.2 if no fixed)
IPREMOTE=0.0.0.0             # IP number of ISP
INTERFACE=ippp0
/sbin/modprobe hisax type=11 protocol=2
/sbin/isdnctrl verbose 3 system on
/sbin/isdnctrl addif $IF
/sbin/isdnctrl secure $IF on
/sbin/isdnctrl addphone $IF out $MSNREMOTE
/sbin/isdnctrl eaz $IF $MSNLOCAL
/sbin/isdnctrl huptimeout $IF 300
/sbin/isdnctrl 12_prot $IF hdlc
/sbin/isdnctrl 13_prot $IF trans
/sbin/isdnctrl encaps $IF syncppp
# /sbin/isdnctrl dialmode $IF auto
/sbin/ifconfig $IF $IPLOCAL pointopoint $IPREMOTE -arp -broadcast
/sbin/ippd /dev/ippp0 user $ACCOUNT $IPLOCAL:$IPREMOTE
```

To start this at boot time, make it executable and append the following to */etc/rc.d/rc.local*:

```
if [ -x /etc/rc.d/rc.isdn ]; then
    . /etc/rc.d/rc.isdn
fi
```

The ipppd command gets its parameters passed through a file, */etc/ppp/ioptions*:

```
-ac
-bsdcomp
debug
defaultroute
ipcp-accept-local
ipcp-accept-remote
mru 1524
mtu 1500
noipdefault
-pc
useifip
-vj
-vjccomp

#idle 360
#persistent
```

Warning: do NOT specify +pap or +chap in this file. This specifies the authentication that ipppd should use for an INCOMING client. If you were to use this to connect to your ISP, ipppd would wait for the ISP to authenticate itself using the specified protocol.

Beware: it is important to emphasize that every special character, thus every character that is not [a-ZA-Z0-9] and '_' should be escaped by preceding it with a '\' -character. Thus 'e!b\$l+' would become 'e\\!b\\\$l+'. Try it if you are having troubles !

Finally, create */etc/ppp/ip-down.local* to handle the shutdown of the interface:

```
#!/bin/sh
/sbin/ifconfig $1 down
sleep 1
/sbin/ifconfig $1 10.0.0.2 pointopoint
```

Note: this is to handle some problems with routes on shutdowns. Anyone know of a clean(er) solution ?

pap-secrets / chap-secrets

If your ISP uses PAP or CHAP, create a file */etc/ppp/pap-secrets* or */etc/ppp/chap-secrets*. Its format is:

#client	server	secret	IP
your_login	*	your_pass	*

Network

Not really related to ISDN, but a lot of people forget this step (too eager to try out all the stuff they typed in above ? :-)).

Anyway, you need to configure the DNS, by creating a file */etc/resolv.conf*:

```
domain your_domain_of_your_isp
nameserver your_primary_nameserver
nameserver your_secondary_nameserver
```

File permissions

Before you can run a (shell)script, it must be set executable. Be sure that you set the permissions so that other users cannot see the passwords stored in the files. If you want other users to be able to dial in, you might want to consider using `sudo`. You might want to do the following:

```
chmod u+rwx og-rwx -r /etc/ppp
chmod u+x /etc/rc.d/rc.isdn /etc/ppp/ip.down-local /usr/local/bin/isdn
```

Dial + Hangup

Finally, you can write a little wrapper to start and stop the ISDN connection. I've put this as `/usr/local/bin/isdn`:

```
#!/bin/bash
case $1 in
    on|start)
        /sbin/isdnctrl dial ippp0
        ;;
    off|stop)
        /sbin/isdnctrl hangup ippp0
        ;;
    info|status)
        /sbin/isdnctrl list ippp0
        ;;
    *)
        echo "Usage: isdn on|off|info|start|stop|status"
        ;;
esac
```

Then if `/usr/local/bin` is in your PATH, you can easily dial in with:

```
isdn on
```

and hangup with:

```
isdn off
```

3.3 Cablemodem (DHCP)

DHCP was designed to make life easier, and most of the times it does ;) More information to set up your DHCP client can be found at: <http://www.oswg.org/oswg-nightly/DHCP.html> and a list of Frequently Asked Questions at: <http://web.syr.edu/~jmwoebus/comfaqs/dhcp.faq.html> which describes everything you need to know. Along with the information in the Cable-Modem HOWTO (<http://www.oswg.org/oswg-nightly/Cable-Modem.html>).

Lots of people want to connect a whole network to their cablemodem, that's not a problem. You'll need IP-Masquerading (<http://www.linuxdoc.org/HOWTO/IP-Masquerade-HOWTO.html>) and make sure the interface (that speaks to the cablemodem) has the right MAC-address !! Another solution (in case of problems) is to reset your cablemodem.

6.3 HOWTO translations

As Dutch is less wide-spread, it is the least supported. But work is being done to resolve this ;) (and maybe *you* can help !?!) French and German translations obviously are already taken care of.

Dutch

A succesfull initiative is making progress, but there's still a lot to do. If you want to help, start translating and send it there. Check: <http://nl.linux.org/doc/HOWTO/>.

French

French translations of HOWTO's can be found at:

<ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO/translations/french/>

German

German translations of HOWTO's can be found at:

<ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO/translations/german/>

6.4 FTP

Most of the times, it doesn't matter where you got it from, as long as it works. But to save you some time and save us some bandwidth, it's much better to get it near you ;) Naturally I forgot some, please send your additions or corrections.

6.7 IRC

The fastest medium to get support is IRC, but beware. Because IRC is rather anonymous it's also easy to fool people.

On IRCnet there's a channel called #linux.be that is closely related to bcol and the Belgian Linux-scene. The channel is still small, but it surely will grow in time. To get help in English, there's only one place #linux.

Also Dalnet has a #linux.be channel.
